

Hodgson Russ Renewable Energy Alert April 23, 2024

Building upon its efforts at better aligning the State's regulatory structure with a transforming energy market and the guiding principles first articulated in its Reforming the Energy Vision ("REV") proceeding,[1] New York is taking new steps to support and promote the updating of the physical transmission grid and the needed adaptation of utility business models that have remained largely within a traditional monopoly provider paradigm. Explicitly acknowledging that State progress towards its aggressive greenhouse gas emissions reductions goals are stalling, the Public Service Commission ("PSC" or "Commission") is seeking to jump start the essential process of grid modernization by launching a "Grid of the Future" Proceeding, [2] which it describes "as an opportunity to establish a comprehensive strategy to deliver a more reliable, affordable, and decarbonized grid for all New Yorkers, building upon the investments in a smart and connected grid made to-date." [3] Accordingly, with the stated objective to "establish a clear set of needed grid capabilities," establish targets for deployment, identify related investments, and anticipate customer benefits and saving, Department of Public Service Staff ("DPS Staff") are directed to develop and file the first iteration of the "New York Grid of the Future Plan" by December 31, 2024.[4]

The genesis of the Grid of the Future proceeding was the Governor's State of the State presentation which described it as follows:

As economic development projects blossom around the state and more New Yorkers electrify with EVs and heat pumps, New York has a once-in-ageneration opportunity to plan investments that build a truly affordable, resilient and clean grid. Governor Hochul is directing the Department of Public Service to harness innovation by initiating the New York Grid of the Future proceeding. The proceeding will identify smart grid technologies that will enable flexible services, like virtual power plants, that can be deployed to achieve our clean energy goals at a manageable cost. This proceeding will deliver a New York Grid of the Future Plan by the end of 2024, laying out clear targets for needed capabilities, required investments, and expected benefits and savings.[5]

In accordance with the Governor's objectives, the proceeding will be focused on possible future actions to be taken by the State to promote the timely evolution of the electric grid, and to develop an "actionable framework for evolving the electric system." [6]

With this focus on the grid's essential role in achieving the decarbonization goals codified in the Climate Leadership and Community Protection Act ("CLCPA"), together with the specific procurement and investment targets laid out in other REV-related proceedings, such as procuring ten (10) gigawatts ("GW") of distributed solar capacity and three (3) GW of energy storage by 2030, and nine (9) GW of offshore wind ("OSW") capacity by 2035, the Grid of the Future Order directs the DPS Staff to create two documents focused on New York's transition to a "more flexible, affordable, reliable, interconnected, and automated grid [that is] value-driven to ensure that such transition is beneficial to all customers."[7]

First will be a "Grid Flexibility Study" to identify potential areas of action. According to the Order, grid flexibility services "represent the grid's ability to shift either demand or supply to meet bulk power system and/or local distribution system needs." [8] Examples given in the Order are Distributed Energy Resources ("DERs") and virtual power plants ("VPPs"), which are defined as "aggregations of DER that can balance electricity demand and supply and provide utility-scale and utility-grade grid services like a traditional power plant." [9] Other examples of grid flexible services are demand-response tools, smart meters, thermostats and appliances that help manage demand peaks, improved operations capabilities such as shorter dispatch intervals and better weather forecasting, and advanced inverters and plant control and communication systems that can, for example, respond to automatic generation control signals and autonomously deliver fast grid-stabilizing frequency response. The specific parameters and goals of the Grid Flexibility Study were set by the Commission:

- 1. Assess the present and potential future capabilities of flexible resources.
- Identify, characterize, and recommend means and methods for effectively integrating flexible resources into grid planning and operations under a range of different scenarios, and
- 3. Recommend near term actions to better deploy identified resources.

The scenarios to be examined must address both summer and winter peak loads; consider needs on different levels of the power grid; consider regional differences between upstate and downstate utilities; and identify barriers to resource deployment with estimates for potential deployment under current conditions and the potential

Practices & Industries

Renewable Energy

once those barriers have been addressed.[10]

This study is scheduled to be complete by November 15, 2024.

The Order then turns to the Grid of the Future Plan itself. While acknowledging the Plan will evolve with stakeholder input, initial required elements are:

- An inventory must be prepared of the resources needed, characterized by the services provided, identifying how much of
 each resource is needed, who can potentially provide them, how they will be obtained, and what the barriers are for
 obtaining them.
- Building on each utility's Distributed System Implementation Plan ("DSIP"), the Plan will determine how the utilities
 can support the expected needs and innovation for evolution of the grid, with a new and/or improved DSIP process as the
 result.
- Financial aspects necessarily play a key role in the Plan. First, DPS Staff is to recommend new or compensation structures
 for the flexible resources.
- Second, the Plan should show how customer savings and benefits are to be identified and promoted through better price signals on utility bills.
- The needs of market participants such as New York Independent System Operator, Inc. ("NYISO") and utilities must be identified; the opportunity for changing roles and responsibilities for these participants also must be identified, along with improved interoperability among them.
- Changes in technology and information infrastructure must be accounted for.
- Acknowledging the reality of our times, there must be "rigid physical and cybersecurity protocols" included.
- The DPS Staff must address the geographic and temporal variability between upstate and downstate systems, involving such matters as transmission, distribution, and environmental constraints, grid configuration differences, (i.e., radial vs. meshed), regional demographics, as well as local laws and moratoriums.
- Finally, recognizing the significant cost implicated by upgrading the grid, the Plan must provide for a fair allocation of costs and benefits among customer classes.

The Order directed the DPS Staff to complete its work by the end of 2025 but authorized the Secretary to grant the staff extensions as necessary. The timeline is:

- 1. DPS Staff is to convene at least one technical conference during the second half of 2024.
- 2. DPS Staff are to file the Grid Flexibility Study by November 15, 2024.
- 3. The first draft of the Grid of the Future Plan is due no later December 31, 2024.
- 4. After soliciting input and reviewing the first draft of the Grid of the Future Plan, staff is to file an updated Grid of the Future Plan by December 31, 2025.

With this schedule, PSC action approving the plan will not occur before 2026. It is too early to say whether that approval will implement specific programs, or if other proceedings, such as a separate proceeding on VPP or other programs, will commence thereafter.

Hodgson Russ Insights: The Order addresses a number of concerns attendant to the state's aggressive energy transition efforts and continues the REV's customer-centric focus. The Order effectively acknowledges that while existing market structures and incentives have moved New York towards its goals, current provisions may not be delivering a sufficient price signal to developers, utilities, and customers for incentivizing deployment of the grid flexible resources. The energy transition, with its significant increase in intermittent generation sources, is increasing flexibility requirements along with variability in generation. The Order represents a bold effort at building a roadmap for integrating market-based incentives and technological improvements in a cost-efficient, resilient grid. Similar to other REV-related proceedings, the Commission is now explicitly recognizing that the energy transition has created a need to evaluate the changing roles and responsibilities of the State's distribution utilities, the NYISO and a multitude of new market participants. Moreover, the Commission is acknowledging that the grid of the future will be incompatible with the traditional, highly centralized, top-down approaches of the past.

As a consequence, while utilities will play a key role implementing whichever programs arise out of the grid of the future proceeding - expect them to push to be the dominant provider of solutions, including further efforts chipping away prior PSC divesture orders - there should be significant opportunities for third-party software and physical solutions, including renewable energy generators and energy storage companies, and those providing energy-efficiency, DRM, and other load reduction alternatives. Stakeholders should begin preparing now to present innovative solutions to the DPS during the yet-to-be scheduled technical conference, to ensure that novel and cost-effective solutions and innovations are incorporated into the discussion early.

Hodgson Russ will be following the progress of the proceeding. If you have questions about the order, including about current incentives and opportunities, contact John Dax, Daniel Spitzer, or William McLaughlin or any other member of our Renewable Energy Practice.
